

So the first thing I did was to try and just jump into HTML, and also the CSS. Since I am not that good with front end development. So when I went ahead and jumped in, I ended up writing out a bunch of things that were not well thought out and I was overzealous with. I ended up being confused with attempting to add certain things. So essentially, I went ahead and renamed and removed and added a bunch of divs and classes only to have to delete my CSS since I am not able to figure out class names.

Something That I had a lot of trouble with despite restarting is adding certain things like properly aligned items in the webpage like the picture. Another issue I had was making things responsive as the page resized. The issue was glaring because I did not have the proper divs and classes set up prior to restarting all of the code. So after I managed to do this, I was able to create a good website overall.

Most of the issues I had were fixed by restarting from scratch and lots of googling. I was able to create the proper cards with responsive resizing after I figured out how to ask the question on google. There were great examples but no single solution was what I wanted. I did use W3 solutions a lot! Another issue I had was figuring out how to use JavaScript in my website. Another issue I had was colors. I did not want a monochrome website, but also I did not want issues with colors, so I think I was able to get a good contrast going.

If I had more experience I would want better transitions to hover over to become larger and smaller depending on if I am hovering over them. This would likely require JavaScript and CSS. I started the cards with this in mind but could not accomplish this before the due date. I would also use better pictures and better resizing options for the web page. I am not very happy with how that ended up being, especially the picture of me.
